

**Sugar Suite for ArcGIS®**  
Providing ArcGIS users with transportation planning and operations capabilities

Citilabs is proud to announce a new family of ArcGIS Extensions for transportation planners, engineers, and GIS professionals. Sugar software tools are extensions built specifically for ESRI users. Each extension is designed to support specific user needs or organizational operations. Sugar extensions are sold separately but all deliver Citilabs' powerful transportation software capabilities via ESRI's world leading GIS framework. Sugar empowers the enterprise with GIS tools that are focused on addressing the specific needs of your organization.

**Sugar Network Editor – transportation network editor**

For users of ArcGIS, the Sugar Network Editor is an extension that efficiently codes and maintains the appropriate topology of roadways, public transit services, and intersection related data (traffic signals).

**Sugar Graphics – transportation mapping**

A plug-in extension for ArcGIS, Sugar Graphics is a suite of transportation mapping tools that enables users to graph roadway traffic, speeds, and congestion. It can also be employed to map public transport ridership as well as stop level on and offs.

**Sugar Signal – traffic optimization**

Citilabs' Sugar Signal provides you with the ability to easily define all types of detailed traffic control within GIS transportation networks. It allows both operational and planning level analysis giving practitioners the ability to analyze and optimize control type, geometries, and timings. All traffic control and count data are stored within a modern geodatabase environment and results are provided in a variety of data formats and maps.

**Future Releases:**

**Sugar Works**

workzone simulation

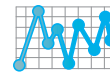

**Sugar Impact**

traffic impact analysis

**Sugar Accident**

accident data and analysis

**Sugar Transit**

ridership estimation

**Sugar Access**

transportation accessibility
